## Basic Attention Token (BAT) Token

\$0.6567

Basic Attention Token (BAT) is an ERC20 token built on top of [Ethereum](#). It launched its crowdsale in May 2017 which saw the tokens fully subscribed and raised \$35 million in 30 seconds. The Basic Attention Token aims to fix digital advertising, which is broken, fraudulent and opaque.

Basic Attention Token work by having advertisers pay BAT to website publishers for the attention of users. Users will also receive BAT from the advertisements that is being served to them. By using the blockchain, digital advertising will be more transparent.

Basic Attention Token is created by the team that built the [Brave browser](#), an open-source, privacy-focused browser that blocks ads and trackers. The browser measures user attention and rewards publishers for users attention.

<b>Monero (XMR)</b>	<b>Coin</b>	<b>Minable</b>	<b>\$407.5922</b>
---------------------	-------------	----------------	-------------------

Monero (XMR) is a new privacy-centric cryptocurrency based on the CryptoNote protocol. Monero is competing directly with coins like Darkcoin, AnonCoin, and LibertyCoin in solving the problem of making digital cash transaction anonymous. CryptoNote features an entirely new code base and is not a fork of Bitcoin. More info about CryptoNote can be found at their website <https://cryptonote.org/> CryptoNote uses Ring Signatures to conceal sender identities via mixing and it also has unlinkable transactions that is achieved using 1-time keys for each individual payments. CryptoNote should not be confused with CoinJoin. Although they are both aiming to make digital transaction anonymous, they are two entirely different implementation.

<b>Ripple (XRP)</b>	<b>Coin</b>	<b>\$3.3025</b>	<b>\$3.05</b>
---------------------	-------------	-----------------	---------------

Ripple is a global settlement network, making it easy to transfer nearly any currency to anyone in the world in just seconds. The Ripple platform has rendered the archaic system of sending money through SWIFT or Western Union obsolete. At this point, Ripple is focused entirely on working with banks, offering them a more efficient and cost-effective way to send real-time payments around the world. Consider this hypothetical example. Directly transferring currency inexpensively from Japan to Nicaragua, JPY/NIO isn't generally feasible. Instead, an individual or bank will usually trade JPY to USD and then USD to NIO. At

each step, the fees add up, making for an expensive way to send money internationally. By using Ripple, one can trade JPY to XRP (Ripple's currency) relatively inexpensively, send XRP to the recipient, either an individual who has a Ripple wallet or a bank in Nicaragua, and from there, trade XRP into NIO. In other words, XRP is the grease that allows any currency to be easily exchanged for any other currency on the Ripple platform.

<b>Siacoin (SC)</b>	<b>Coin</b>	<b>Mineable</b>	<b>\$0.0447</b>
---------------------	-------------	-----------------	-----------------

Sia is a decentralized cloud storage platform similar in concept to Dropbox and other centralized storage provider where instead of renting storage space from a centralized entity, clients rent storage space from other peers. Nodes provide storage to clients using the Sia blockchain as contracts. Before storing the data, the data is encrypted into many pieces and uploaded to different hosts.

The Sia developers mined the first 100 blocks of Sia where the rewards begin with 300,000 Siacoins for the first block and each subsequent block reward decreases by 1 SC until the block reward stabilizes at 30,000 Siacoins per block.

Sia has a second cryptocurrency called Siafund where 3.9% of all successful storage contract payouts go to the holders. The Siafund is 100% premined with 10,000 units in total, of which 87.5% is owned by Sia's parent company, Nebulous Inc. Siafund is created to finance the early development of Sia without relying on donations or premine.

<b>Stellar (XLM)</b>	<b>Coin</b>	<b>\$0.7810</b>	<b>\$0.69</b>
----------------------	-------------	-----------------	---------------

Stellar is an open sourced decentralized protocol to transfer money in any pair of currencies.

For instance, Joe can send a USD transaction to Marie in Euro or Bitcoin seamlessly.

The way it works is by using Lumens as an intermediary currency for conversion between currencies. Money balance is maintained via a gateway, a network participant whom you trust to accept a deposit in exchange for credit on the network.

Stellar's mission is to expand financial access and literacy worldwide.

Stellar is a decentralized protocol for sending and receiving money led by Jed McCaleb from Ripple and the original founder of Mt. Gox.

Others to Look into:

ARK

Tether

Cardano

- 1.) Go to Cryptocurrency Market Capitalizations | CoinMarketCap
- 2.) Copy the top 100 into a spreadsheet, ordered by market cap (largest to smallest)
- 3.) The next day, open a new tab and copy in the top 100 for that day, ordered by market cap (largest to smallest)
- 4.) Take a close look at those coins that have entered the top 75 and top 50 that weren't previously in it
- 5.) If a coin enters the top 50 and quickly enters the top 45 or 40, then that is a good reason to investigate (read: potentially buy)

**\*\*\*Cardano      \$300 – 285 ADA (get 300)      2428.42%**

Pro: Open communication, coin/product strength, github, brand

Con: Only 1 advisor has led multi million dollar company

<https://www.cardanohub.org/en/home/>

#### Short description

Cardano is a decentralised public blockchain and cryptocurrency project and is fully open source. Cardano is developing a smart contract platform which seeks to deliver more advanced features than any protocol previously developed.

#### Abstract

Cardano is a revolutionary blockchain technology designed to build a new decentralised economy and democratize finance in emerging markets. Cardano will allow decentralised applications and contracts to be built and executed in a low-cost, secure and scalable way. The Cardano project is different: it openly addresses the need for regulatory oversight whilst maintaining consumer privacy and protections through an innovative software architecture. The protocol features a layered blockchain software stack that is flexible, scalable, and is being developed with the most rigorous academic and commercial software standards in the industry. Cardano will use a democratic governance system that will let the project evolve over time, and fund itself sustainably through a visionary treasury system.

**\*\*IOTA      \$250 – 65 MIOTA (get )      698.75%**

Pro: Open comm, product/coin strength, github, brand, advisory board

Con:

<http://iota.org/>

#### *IOTA purpose and aspects*

High scalability, no mining, no blocks, no difficulty, no transaction fees, Trustless transactions between parties, Freedom of payments, Counterfeiting impossible, Fraud resistant, No single point of failure, No % based transfer costs, free to hold

#### *IOTA additional differentiation against competition*

Protocol is a directed acyclic graph (DAG) called the tangle instead of the traditional blockchain. Where a blockchain is a linked list where every block points to a unique descendant, in the tangle, a block links to two previous blocks.

**\*\*Tron      \$250 – 1158 TRX (get 1150)      1203.72%**

Pro: Open communication, brand, coin strength,  
Con: Low leadership, no github presence, no advisory board

<https://tronlab.com/>

#### Short description

TRON is a blockchain-based decentralized protocol that aims to construct a worldwide free content entertainment system with the blockchain and distributed storage technology. The protocol allows each user to freely publish, store and own data, and in the decentralized autonomous form, decides the distribution, subscription and push of contents and enables content creators by releasing, circulating and dealing with digital assets, thus forming a decentralized content entertainment ecosystem.

#### Abstract

With the strengths of social network and value network, TRON is committed to ecological prosperity. In relation to any community, economy and free market economy, an incentive system that fairly and reasonably reflects the contributions made by participants is fundamental. TRON will attempt to accurately and transparently measure and motivate relevant participants and contributors using digital assets for the first time, thus enabling content ecosystem

distribution, subscription and push of contents and enables content creators by releasing, circulating and dealing with digital assets, thus forming a decentralized content entertainment ecosystem.
